# Persistent negative summer NAO associated with high ice sheet melt

**2012**

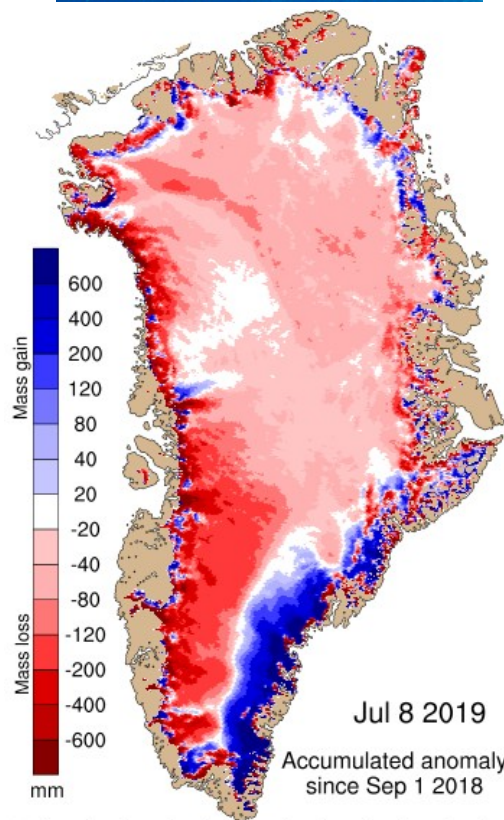

**2019**

## POLAR PORTAL

MONITORING ICE AND CLIMATE IN THE ARCTIC

= geopotential height of 500 hPA area-averaged over Greenland

- Associated with NAO, high GBI also enhances ice sheet melt

May-July 2012  
pressure

geopotential height anomaly at 700 mb (meters)

-65 0 65

temperature

difference from average temperature at 700 mb (°F)

-11 0 11

## Used Models

AWI-CM
CanESM2
CESM2
CNRM-CM5
EC-Earth3
GISS GCM
IPSL-CM6
MIROC
MRI-ESM2
UKESM1

**blue:** only historical simulation  
available

**yellow/orange:** historical  
simulation and future projections  
SSP245 and SSP585

## EC -Earth3

ta\_Amon\_EC-Earth3\_historical.mat  
versus ERA5\_monthly-temp\_85000.mat  
Months: 0 0 0 0 0 1 1 1 0 0 0 0  
Mean Temperature Difference: -0.99K

## UKESM

ta\_Amon\_UKESM1-0-LL\_historical.mat  
versus ERA5\_monthly-temp\_85000.mat  
Months: 0 0 0 0 0 1 1 1 0 0 0 0  
Mean Temperature Difference: -0.51K

## CESM2

ta\_Amon\_CESM2-WACCM\_historical.mat  
versus ERA5\_monthly-temp\_85000.mat  
Months: 0 0 0 0 1 1 1 0 0 0  
Mean Temperature Difference: -0.049K

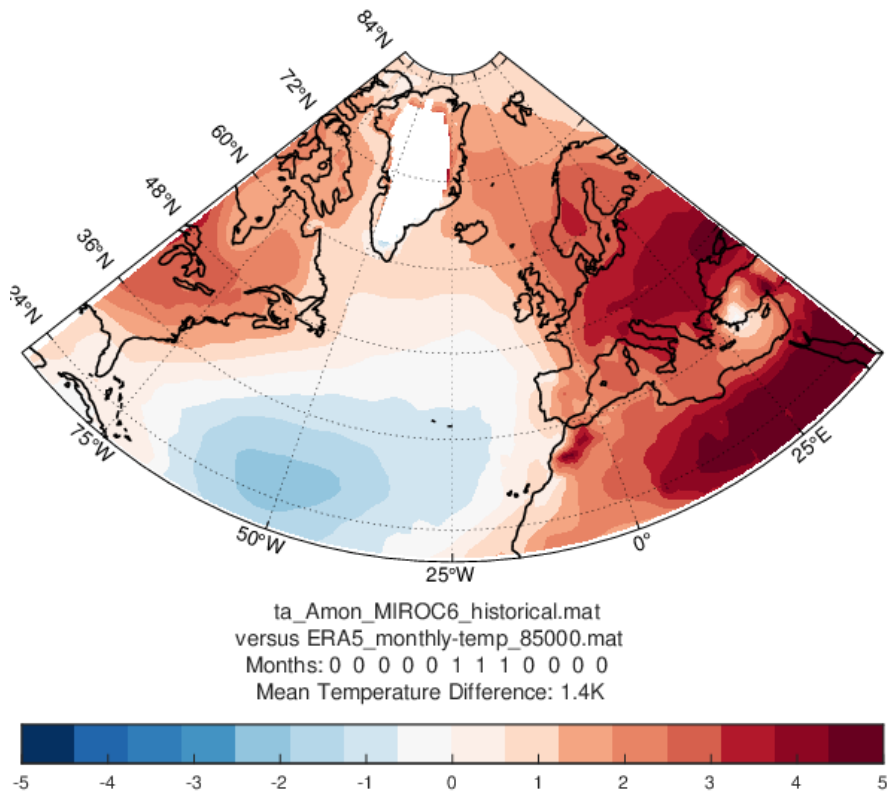

## CanESM5

ta\_Amon\_CanESM5\_historical.mat  
versus ERA5\_monthly-temp\_85000.mat  
Months: 0 0 0 0 1 1 1 0 0 0  
Mean Temperature Difference: 0.046K

## MIROC6

## EC -Earth3

ta\_Amon\_EC-Earth3\_historical.mat  
versus ERA5\_monthly-temp\_85000.mat  
Months: 1 1 0 0 0 0 0 0 0 0 1  
Mean Temperature Difference: -0.7K

## UKESM

ta\_Amon\_UKESM1-0-LL\_historical.mat  
versus ERA5\_monthly-temp\_85000.mat  
Months: 1 1 0 0 0 0 0 0 0 0 1  
Mean Temperature Difference: -1.2K

## CESM2

ta\_Amon\_CESM2-WACCM\_historical.mat  
versus ERA5\_monthly-temp\_85000.mat  
Months: 1 1 0 0 0 0 0 0 0 0 1  
Mean Temperature Difference: -0.57K

## CanESM5

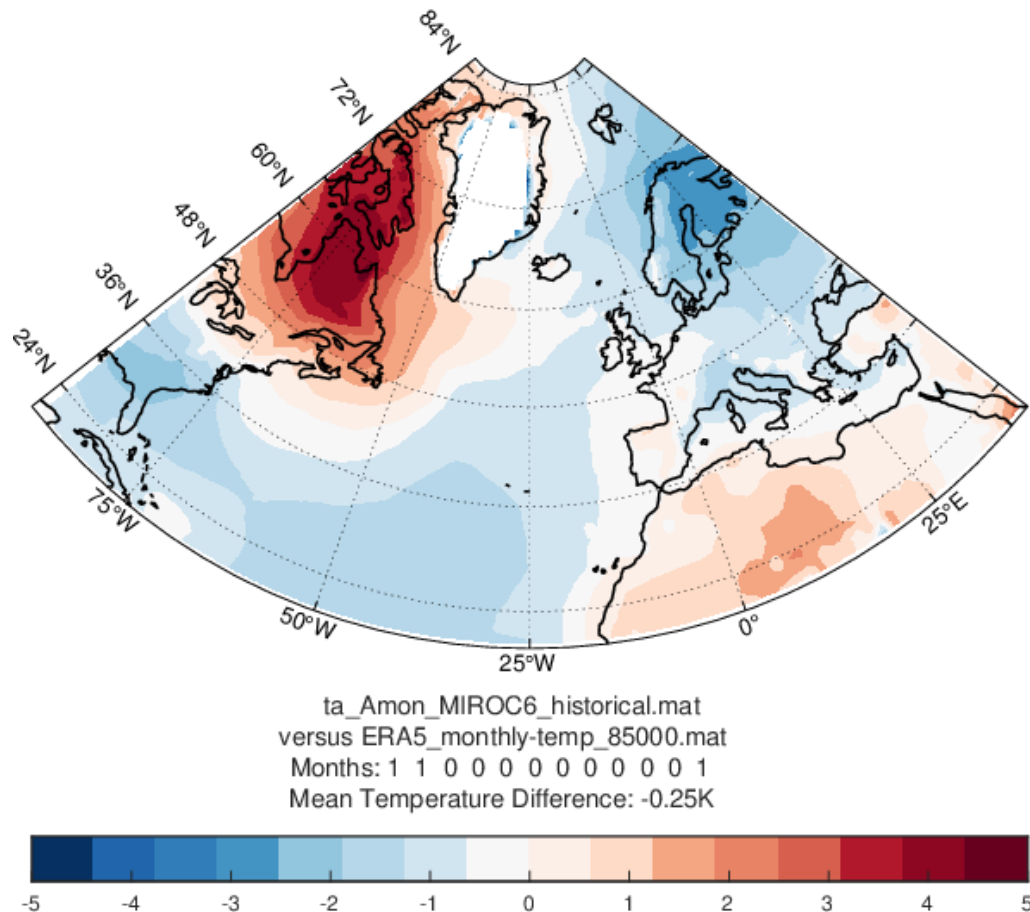

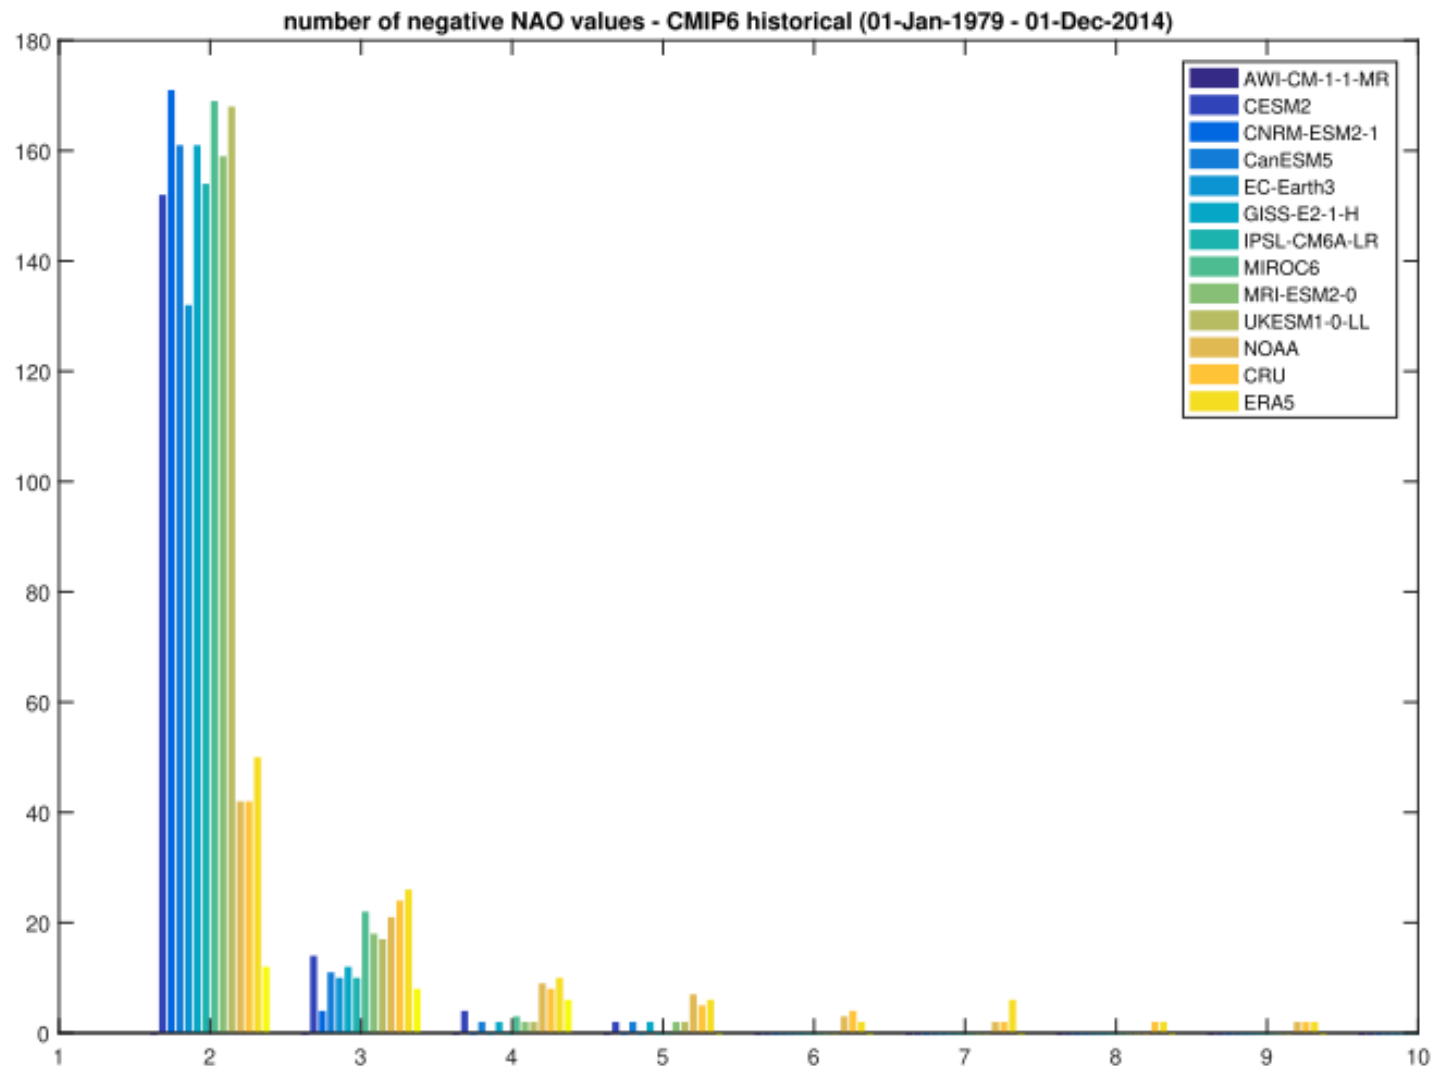

ta\_Amon\_CanESM5\_historical.mat  
versus ERA5\_monthly-temp\_85000.mat  
Months: 1 1 0 0 0 0 0 0 0 0 1  
Mean Temperature Difference: -2K

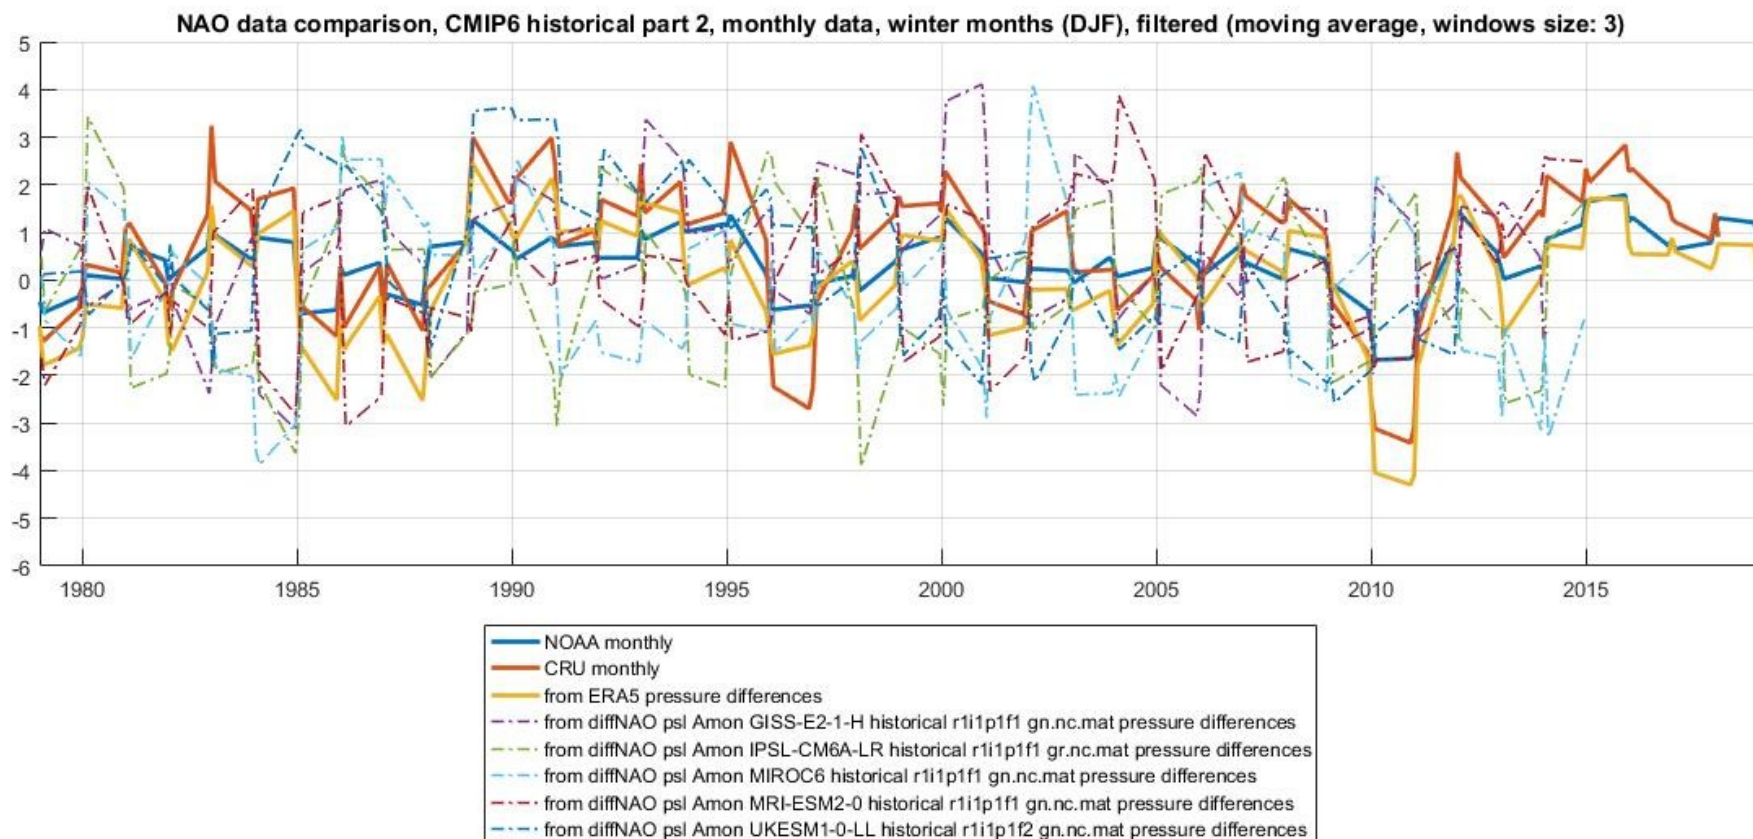

## MIROC6

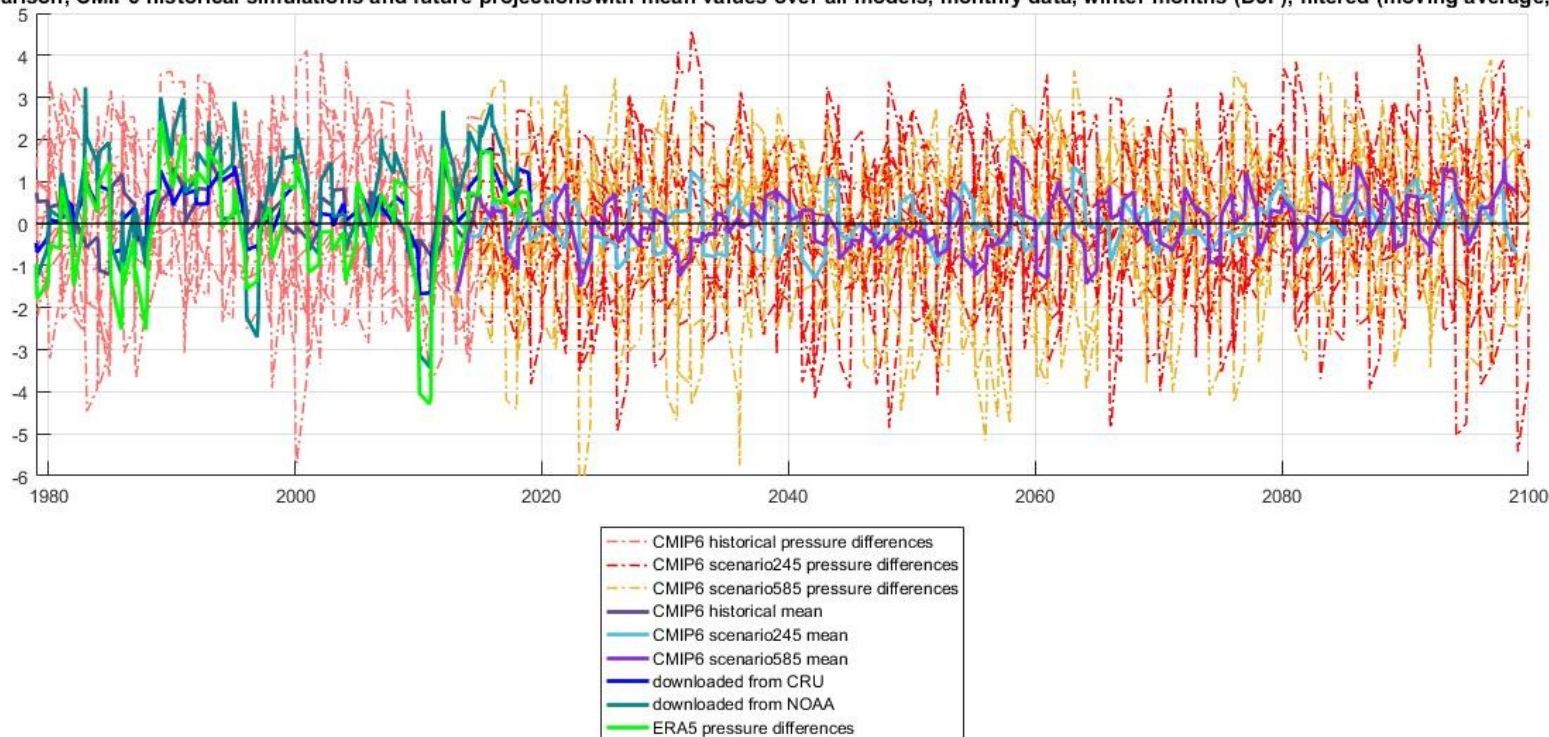

NAO data comparison, CMIP6 historical part 1, monthly data, winter months (DJF), filtered (moving average, windows size: 3)

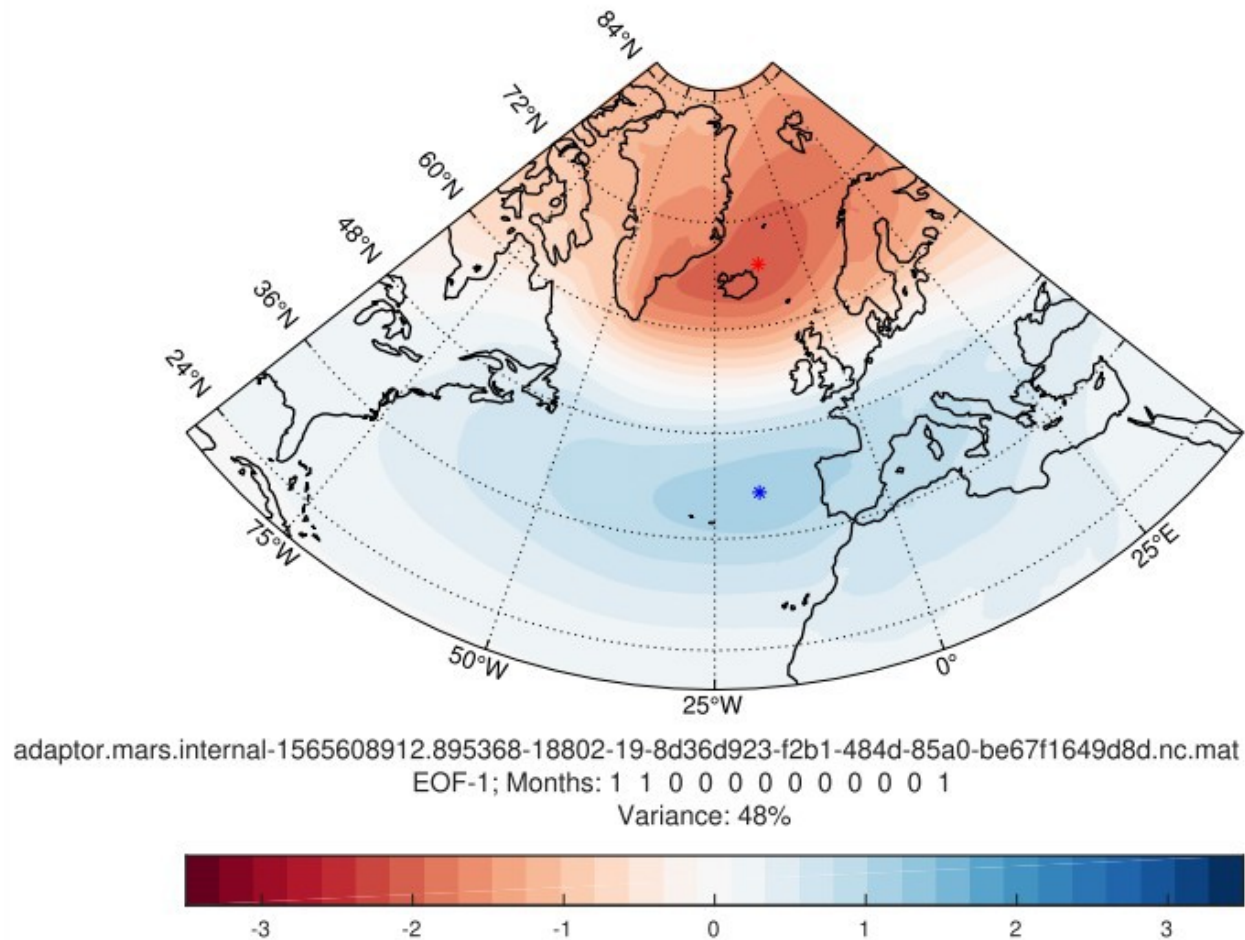

NAO data comparison, CMIP6 historical simulations and future projections with mean values over all models, monthly data, winter months (DJF), filtered (moving average, windows size: 3)

## NAO from Principal Component Analysis - Empirical Orthogonal Function

years 1979 - 2015

ERA5

EC-Earth

UKESM

years 1979 - 2015

ERA5

AWI-CM

CESM2

years 1979 - 2015

ERA5

CanESM5

MIROC6

**and the winner is...**

**(okay, that's valid for this very special paramter...)**

1	UKESM	381,03
2	EC-Earth3	741,71
3	CNRM	1041,65
4	IPSL	1111,92
5	GISS	1516,75
6	CESM2	1536,71
7	MRI	1900,37
8	AWI	1962,17
9	MIROC6	1972,86
10	CanESM5	3072,32

**SSP 245**

*years 2080 - 2100*

**SSP 585**

**EC-Earth**

**ERA5**

psl\_Amon\_EC-Earth3\_ssp245\_r1i1p1f1.mat  
EOF-1; Months: 1 1 0 0 0 0 0 0 0 1  
Variance: 48.8%

psl\_Amon\_EC-Earth3\_ssp585\_r1i1p1f1.mat  
EOF-1; Months: 1 1 0 0 0 0 0 0 0 1  
Variance: 39%

psl\_Amon\_UKESM1-0-LL\_ssp585\_r1i1p1f2.mat  
EOF-1; Months: 1 1 0 0 0 0 0 0 0 1  
Variance: 45.8%

**UKESM**

psl\_Amon\_UKESM1-0-LL\_ssp245\_r1i1p1f2.mat  
EOF-1; Months: 1 1 0 0 0 0 0 0 0 1  
Variance: 52.6%

# Take Away Messages

- It's important to look not only on absolute, but also on large scale circulation indices like NAO
- The more extreme the scenarion, the more differences in the ensemble spread
- Have a look on the geographical distribution --> EOF analysis
